**Presentation by Berk Sudan**

# What Kind of Pet Should You Get?

### A Flow Chart

Do you want to be loved?

yes.

I guess?

## Are you a dreamer or a realist?

Do you mind fur?

Realist.

Dreamer

Unicorn

No fur!!!

I can handle it!

Are you scared  
of reptiles?

How do you feel about being mainstream?

about  
?

Are you fit?

I go to coffee  
shops you've  
never heard  
of.

I love MTV.

yes.                      no.

Chase/wrestle  
your pet?

Goldfish.

1

Ferret.

food?

No pet for you.  
you should love  
your pet no  
matter what  
SAT Score  
it gets.

ss!" "w

What? / 00

o. Yes!

Do you pretend to be Australian sometimes?

Turtle.

Cat.

1  
Do you have

Do you have maternal instincts?

"What?"

"Yasss!"

Lizard.

Crocodile

No.  
1

1

Hamster.

Have a  
baby.

# Information Gain with Example

# Entropy (Expected Information)

Expected information (entropy) needed to classify a tuple in D:

$$Info(D) = -\sum_{i=1}^m p_i \log_2(p_i)$$

Information gained by branching on attribute A

$$Gain(A) = Info(D) - Info_A(D)$$

# Information Gain

$$\text{Information gain} = \text{entropy (parent)} - [\text{weightes average}] * \text{entropy (children)}$$

# Self Driving Car Example

1	Grade	Bumpiness	Speed Limit	Speed
2	steep	bumpiness	yes	slow
3	steep	smooth	yes	slow
4	flat	bumpiness	no	fast
5	steep	smooth	no	fast

- Grade, Bumpiness and Speed Limit are the features and **Speed** is label.
- Total 4 observation.

*Ref: <https://medium.com/coinmonks/what-is-entropy-and-why-information-gain-is-matter-4e85d46d2f01>*

# Self Driving Car Example

1	Grade	Bumpiness	Speed Limit	Speed
2	steep	bumpiness	yes	slow
3	steep	smooth	yes	slow
4	flat	bumpiness	no	fast
5	steep	smooth	no	fast

$$Entropy_{parent} = - \sum P_{slow} \log_2(P_{slow}) + P_{fast} \log_2(P_{fast})$$

Ref: <https://medium.com/coinmonks/what-is-entropy-and-why-information-gain-is-matter-4e85d46d2f01>

# Self Driving Car Example

1	Grade	Bumpiness	Speed Limit	Speed
2	steep	bumpiness	yes	slow
3	steep	smooth	yes	slow
4	flat	bumpiness	no	fast
5	steep	smooth	no	fast

**QUESTION:**  $\text{Gain}(T, \text{Grade}) = ?$

$$\log_2\{1/3\} = -1.6$$

Note: T = set of training instances.

$$\log_2\{2/3\} = -0.6$$

# Gini Impurity

# Gini Impurity - Formula

- Gini uncertainty (Gini impurity):  $G = 1 - \sum_k (p_k)^2$ . Maximizing this criterion can be interpreted as the maximization of the number of pairs of objects of the same class that are in the same subtree (not to be confused with the Gini index).
- Misclassification error:  $E = 1 - \max_k p_k$
